com/nebosh-rg-gc-70-401-course-material-pdf-download-en.html). NEBOSH IGC Introduction The . NEBOSH International General Certificate in Occupational Health is a global qualification awarded by the International NEBOSH IGC Exam Syllabus and Exam Pattern. NEBOSH IGC is the qualification which designed for those people who are interested in the occupational health and safety. This qualification is designed by the World Health Organization (WHO) in the year 2000. It is designed for all the non-medical. The NEBOSH International General Certificate in Occupational Health is a global qualification awarded by the InternationalWith pterosaur and porpoise fossils found near the town of Keuper, in northern Germany, archeologists believe they have found evidence for a first marine animal in Europe: a dolphin. The fossilized remains were discovered last year and a more detailed study of the bones suggests that it's a female dolphin. This is the first porpoise fossil ever found in Europe. Porpoises are a type of dolphin and are distinguished from other species by their distinctive flat, paddle-shaped tail. They are found in warm, coastal waters of the northern hemisphere. Porpoises are known to communicate with squeaks, whistles, and other sounds that can carry over long distances. Related: Dinosaurs at the Smithsonian: Pterosaurs Scientists discovered the dolphin fossil in the Lower Keuper deposits, which is a type of salt formation. These layers of rock were laid down between 35 and 25 million years ago during the Cretaceous period. These layers have yielded the remains of other animals, including crocodiles and fossilized sea turtles. Porpoises are found in warm, coastal waters of the northern hemisphere Based on the fossil, scientists have determined that this porpoise was a female. The lower jaw and teeth suggest that this dolphin was a juvenile or subadult. Other characteristics of the dolphin include a small braincase (rear part of the skull) and a short, narrow beak. This porpoise is the first dolphin found in Europe, but experts believe there are several other species of porpoise that have yet to be identified. The porpoises may have had contact with land animals that were migrating between land and sea. Animals that migrate between the land and the sea are called amphiodonts. Amphiodonts can be reptiles 82157476af
